

CA50E

Receiving Card

Specifications

Change History

Document Version	Release Date	Description
V1.1.1	2023-12-30	Updated feature descriptions.
V1.1.0	2023-04-19	<ul style="list-style-type: none"> • Added the Thermal Compensation feature. • Updated the load capacity related description. • Updated the certification information. • Updated the dimensions diagram. • Updated the pins section. • Updated the packing box dimensions.
V1.0.0	2022-07-09	First release

Introduction

The CA50E is a high-end 5G receiving card in the new-generation control system COEX series of Xi'an NovaStar Tech Co., Ltd. (hereinafter referred to as NovaStar). For 8-bit and 10-bit video sources, a single CA50E supports resolutions up to 768x512@60Hz. For 12-bit video sources, a single CA50E supports resolutions up to 512x480@60Hz.

This receiving card supports the exclusive Thermal Compensation 2.0, Dynamic Booster, Full Grayscale Calibration and LED Image Booster technologies of NovaStar. It also supports the HDR, Frame Rate Adaptive 3.0, Shutter Fit, quick adjustment of dark or bright lines, low latency, the pixel level brightness and chroma calibration, 3D, image rotation in 90° increments, and more, greatly improving the brightness, grayscale and color performance from every aspect and offering users an ultimate visual experience with a uniform, smooth and lifelike image.

The CA50E uses high-density connectors for communication to limit the effects of dust and vibration, resulting in high stability. It supports up to 32 groups of parallel RGB data or 64 groups of serial data (expandable to 128 groups of serial data). Its reserved pins allow for custom functions of users.

Note

To use this product, please contact NovaStar first for solution evaluation and analysis.

Certifications

RoHS

If the product does not have the relevant certifications required by the countries or regions where it is to be sold, please contact NovaStar to confirm or address the problem. Otherwise, the customer shall be responsible for the legal risks caused or NovaStar has the right to claim compensation.

Features

Improvements to Display Effect

- Thermal Compensation 2.0
Work with NovaStar's high-precision calibration system to precisely collect the thermal distribution data of LED cabinets and generate unique thermal compensation data for each pixel of the cabinets, effectively eliminating the cross-shaped blue or red stripes on the cabinet or module display caused by uneven heat dissipation.
- Dynamic Booster
Real-time analysis and dynamic adjustment are made to each frame to significantly improve the display contrast and image details for better visual

- experience, and effectively control and lower the display power consumption, extending the service life of the LED screen.
- Full Grayscale Calibration
Work with NovaStar's high-precision calibration system and the C3200 scientific-grade camera to generate unique calibration coefficients for each grayscale, ensuring uniformity of each grayscale and improving the screen's image quality.
 - LED Image Booster (Effects depend on driver IC)
 - Color Management: Support the standard color gamuts (Rec.709, DCI-P3 and Rec.2020) and custom color gamuts, enabling more precise colors on the screen.
 - Precise Grayscale: Individually correct the 65,536 levels of grayscale (16bit) of the driver IC to fix the display problems at low grayscale conditions, such as brightness spikes, brightness dips, color cast and mottling. This function can also better assist other display technologies, such as 22bit+ and individual gamma adjustment for RGB, allowing for a smoother and uniform image.
 - 22bit+: Improve the LED display grayscale by 64 times to avoid grayscale loss due to low brightness and allow for more details in dark areas and a smoother image.
 - HDR
 - Support HDR10 and comply with the SMPTE ST 2084 and SMPTE ST 2086 standards.
 - Support HLG.
 - Frame Rate Adaptive 3.0
Adjust the receiving card parameters in real time according to the input frame rate, so that the display effect at different frame rates (23 Hz to 240 Hz) is the best.
 - Shutter Fit
Adjust the driver IC parameters according to the camera shutter angle to fix problems of black lines, grayscale addition, and grayscale loss during camera shooting in xR scenarios.
 - Quick adjustment of dark or bright lines
The dark or bright lines caused by splicing of modules or cabinets can be adjusted to improve the visual experience. The adjustment can be in milliseconds.
 - Low latency
The latency of video source on the receiving card end can be reduced to 1 frame (only when using modules with driver IC with built-in RAM).
 - Pixel level brightness and chroma calibration
Work with NovaStar's high-precision calibration system to calibrate the brightness and chroma of each pixel, effectively removing differences and enabling high consistency for both brightness and chroma.
 - 3D
Working with the controller that supports 3D function, the receiving card supports 3D output.
 - Image rotation in 90° increments
The display image can be set to rotate in multiples of 90° (0°/90°/180°/270°).

Improvements to Maintainability

- Calibration coefficient management
The calibration coefficients can be uploaded quickly, read back, and saved to hardware.
- Automatic module calibration
After a new module with flash memory is installed to replace the old one, the calibration coefficients stored in the flash memory can be automatically uploaded to the receiving card when it is powered on, which ensures unchanged uniform display brightness and chroma.
- Module Flash management
For modules with flash memory, the information stored in the memory can be managed. The calibration coefficients and module ID can be stored and read back.
- Quick uploading of calibration coefficients
Upload the calibration coefficients quickly to the receiving cards to improve efficiency.
- One-click application of calibration coefficients in module Flash
For modules with flash memory, when the Ethernet cable is disconnected, users can hold down the self-test button on the cabinet to upload the calibration coefficients in the memory of the module to the receiving card.
- Mapping 2.0
The cabinets can be marked on the screen by the color, Ethernet port number and receiving card number, allowing users to easily obtain the locations and connection topology of receiving cards and quickly complete screen configuration and other operations.
- Setting of a pre-stored image in receiving card
The image displayed when the Ethernet cable is disconnected, during device startup, or when there is no video signal can be customized.
- Cabinet Finder
The cabinet can be marked with a frame on the screen and the indicator status is changed, allowing users to quickly locate the cabinet and troubleshoot problems.

- Temperature and voltage monitoring
The receiving card temperature and voltage can be monitored in real-time without the need for any additional peripherals.
- Bit error detection
The communication quality of the Ethernet port on the receiving card can be monitored in real-time, and the count of error data packets can be recorded. This feature assists users in identifying faults and troubleshooting network communication issues.

Improvements to Reliability

- Dual card backup and status monitoring
In an application requiring high reliability, two receiving cards can be mounted onto a single hub board for backup. When the primary receiving card fails, the backup card can serve immediately to ensure uninterrupted operation of the display.
The working status of the primary and backup receiving cards can be monitored. When either of them fails, the information is reported actively to the control computer or the controller.
- Loop backup
The receiving card and controller form a loop via the primary and backup line connections. When a fault occurs at a location of the lines, the screen can still display the image normally.
- Dual backup of configuration parameters
The receiving card configuration parameters are stored in the application area and factory area of

- Status detection of dual power supplies
When two power supplies are used, their working status can be detected by the receiving card.
- LVDS transmission (dedicated firmware required)
Low-voltage differential signaling (LVDS) transmission is used to reduce the number of data cables from the hub board to module, increase the transmission distance, and improve the signal transmission quality and electromagnetic compatibility (EMC).

the receiving card at the same time. Users usually use the configuration parameters in the application area. If necessary, users can restore the configuration parameters in the factory area to the application area.

- Dual program backup
Two copies of firmware program are stored in the application area of the receiving card at the factory to avoid the problem that the receiving card may get stuck abnormally during program update.
- One-click firmware program learning
The cabinet firmware program and configuration file can be copied to other cabinets with one click to help quickly complete cabinet configuration.

Appearance

High-Density Connectors

All product pictures shown in this document are for illustration purpose only. Actual product may vary.

Indicators

Indicator	Color	Status	Description
Running indicator	Green	Flashing once every 1s	The receiving card is functioning normally. Ethernet cable connection is normal, and video source input is available.
		Flashing once every 3s	Ethernet cable connection is abnormal.
		Flashing 3 times every 0.5s	Ethernet cable connection is normal, but no video source input is available.
		Flashing once every 0.2s	The receiving card failed to load the program in the application area and is now using the backup program.
		Flashing 8 times every 0.5s	A redundancy switchover occurred on the Ethernet port and the loop backup has taken effect.
		Flashing 3 times every 2s	The Cabinet Finder function has taken effect.
Power indicator	Red	Always on	The power input is normal.

Dimensions

The board thickness is not greater than 2.0 mm, and the total thickness (board thickness + thickness of components on the top and bottom sides) is not greater than 9.2 mm. Ground connection (GND) is enabled for mounting holes.

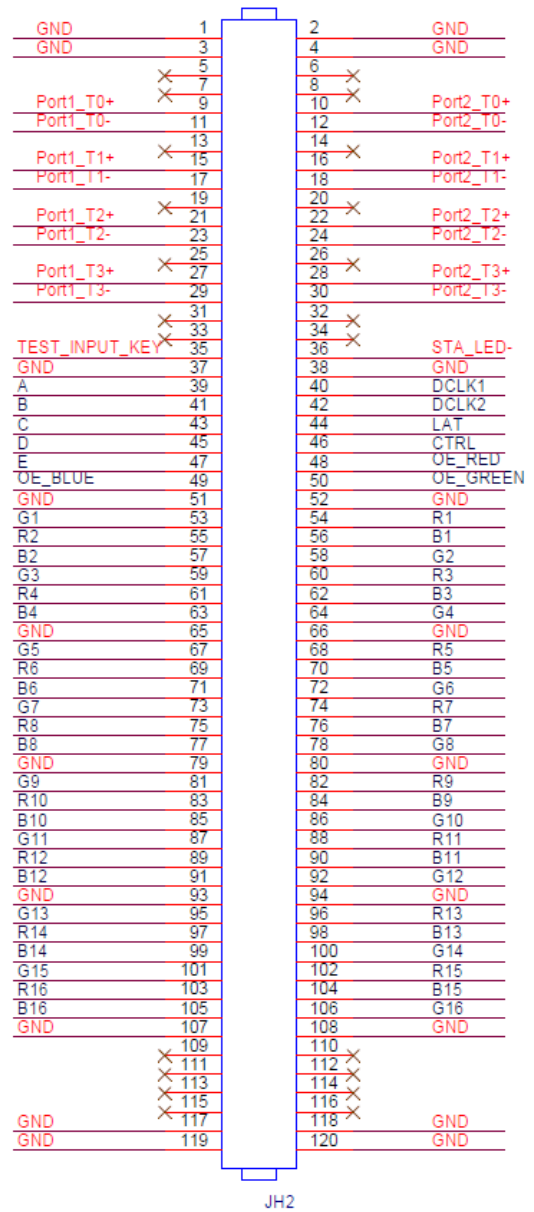

Tolerance: ± 0.3 Unit: mm

To make molds or trepan mounting holes, please contact NovaStar for a higher-precision structural drawing.

Note

The recommended power input is 5.0 V.

OE_RED, OE_GREEN and OE_BLUE are display enable signals. When RGB are not controlled separately, use OE_RED. When the PWM chip is used, they are used as GCLK signals.

In the mode of 128 groups of serial data, Data65–Data128 are multiplexed into Data1–Data64.

Reference Design for Extended Functions

Pins for Extended Functions			
Pin	Recommended Module Flash Pin	Recommended Smart Module Pin	Description
RFU4	HUB_SPI_CLK	(Reserved)	Clock signal of serial pin
RFU6	HUB_SPI_CS	(Reserved)	CS signal of serial pin
RFU8	HUB_SPI_MOSI	/	Module Flash data storage input
	/	HUB_UART_TX	Smart module TX signal
RFU10	HUB_SPI_MISO	/	Module Flash data storage output
	/	HUB_UART_RX	Smart module RX signal
RFU3	HUB_CODE0		Module Flash BUS control pin
RFU5	HUB_CODE1		
RFU7	HUB_CODE2		
RFU9	HUB_CODE3		
RFU18	HUB_CODE4		
RFU11	HUB_H164_CSD		74HC164 data signal
RFU13	HUB_H164_CLK		
RFU14	POWER_STA1		Dual power supply detection signal
RFU16	POWER_STA2		
RFU15	MS_DATA		Dual card backup connection signal
RFU17	MS_ID		Dual card backup identifier signal

Note

The RFU8 and RFU10 are signal multiplex extension pins. Only one pin from either the Recommended Smart Module Pin or the Recommended Module Flash Pin can be selected at the same time.

Specifications

Maximum Resolution	768×512@60Hz (For 8-bit and 10-bit video sources) 512×480@60Hz (For 12-bit video sources)	
Electrical Specifications	Input voltage	DC 3.8 V to 5.5 V
	Rated current	1.35 A
	Rated power consumption	6.8 W
Operating Environment	Temperature	−20°C to +70°C
	Humidity	10% RH to 90% RH, non-condensing
Storage Environment	Temperature	−25°C to +125°C
	Humidity	0% RH to 95% RH, non-condensing
Physical Specifications	Dimensions	80.0 mm × 45.0 mm × 8.6 mm
	Net weight	25.5 g Note: It is the weight of a single receiving card only.
Packing Information	Packing specifications	An antistatic bag and anti-collision foam are provided for each receiving card. Each packing box contains 40 receiving cards.
	Packing box dimensions	381.0 mm × 196.0 mm × 124.0 mm

The amount of current and power consumption may vary depending on various factors such as product settings, usage, and environment.
